

 **What is SOAR?**

- SOAR = Security Orchestration, Automation, and Response
- A platform that automates security operations
- Integrates multiple security tools into one workflow
- Helps organizations detect, analyze, and respond to threats faster

Why SOAR is Important?

- Reduces manual workload for security teams
- Enables faster incident response
- Improves operational efficiency
- Minimizes human errors

How SOAR Works?

- Collects data from security tools
(SIEM, firewalls, etc.)
- Analyzes alerts and incidents
- Executes automated actions using playbooks
- Responds to threats in real-time

Key Components of SOAR

- Orchestration → Connects multiple security tools
- Automation → Automates repetitive tasks
- Incident Response → Manages and resolves threats
- Case Management → Tracks and documents incidents

What are Playbooks?

- Predefined automated workflows
- Execute actions based on specific conditions
- Standardize incident response processes

Example:

Detect threat → Block IP → Send alert

Real-Life Example

- Phishing Attack Response:
- Detect suspicious email
- Analyze attachments/links
- Block sender IP/domain
- Alert security team
- Remove email from inboxes

Popular SOAR Tools

- Splunk SOAR
- IBM Resilient
- Cortex XSOAR
- Tines

SIEM vs SOAR

- SIEM → Collects logs & detects threats
- SOAR → Automates response to threats
- 👉 SIEM = Detection
- 👉 SOAR = Response

Benefits of SOAR

- Faster threat response
- Automation of repetitive tasks
- Improved security efficiency
- Reduced response time
- Better incident management
