

How to Use Proxychains, VPN & TOR for Anonymity

Proxy

- What: Middle server between you and internet.
- Why: Hides your real IP, can bypass restrictions.
- Example: You → Proxy → Website (website sees proxy's IP, not yours).

Proxychains

- What: Tool in Linux to force any program's traffic through proxies.
- Why: Useful in penetration testing for anonymity.
- Example: Run Nmap or Firefox through Proxychains → real IP hidden.

VPN (Virtual Private Network)

- What: Encrypted tunnel between user and VPN server.
- Why: Secures traffic on public Wi-Fi, hides location, bypasses censorship.
- Example: Using VPN in café → hacker on Wi-Fi cannot sniff your data.

TOR (The Onion Router)

- What: Multi-layer encrypted network that routes traffic through random nodes.
- Why: Maximum anonymity, hides origin, hard to trace.
- Example: Journalist using TOR to protect identity in restrictive countries.
