

Ransomware

*Your Data is One Click Away
from Becoming Someone's Hostage.*  

? What is Ransomware?

- Ransomware is a type of malware that encrypts or locks user data
- Attackers demand a ransom payment to restore access
- Targets individuals, businesses, hospitals, and governments
- One of the most financially damaging cyber attacks

How Ransomware Works *(Attack Lifecycle)*

- Infiltration
- Execution
- Encryption
- Ransom Note

Types of Ransomware

Crypto Ransomware

- Encrypts files while OS remains usable

Locker Ransomware

- Completely locks users out of the operating system

Doxware / Leakware

- Threatens to leak sensitive data if ransom is not paid

Ransomware as a Service (RaaS)

- Criminals rent ransomware tools for profit sharing

Why Hackers Demand Cryptocurrency

- Provides anonymity
- Transactions are hard to trace
- Decentralized (no bank control)
- Fast and global payments

How to Prevent Ransomware Attacks

-  System & Network Security
-  Email & User Awareness
-  Access Control

The 3-2-1 Backup Rule

- 3 copies of your data
- Stored on 2 different types of media
- 1 copy kept offline (not connected to the network)

Example:

- Original data on PC
- Backup on external hard drive
- Offline backup on cloud or disconnected storage

What To Do If a Ransomware Attack Happens

-  Immediate Actions
-  Investigation & Recovery
-  Reporting

How to Detect Ransomware Early

- Sudden file extensions changes
- Files become inaccessible
- High CPU or disk usage
- Unknown processes running
- Antivirus alerts or disabled security services

Why You Should Never Pay the Ransom

- No guarantee of data recovery
- Encourages future attacks
- Attackers may target you again
- Paying funds criminal activities

***Ransomware does not break systems,
it breaks unprepared organizations. 🔥***
