

Your next cyber attack may not come from a hacker typing on a keyboard.. it may come from an AI agent, a smart camera, or even your own IoT devices.

AI is Changing Cyber Security

- AI helps detect threats faster
- AI improves automated defense
- AI is also used by attackers

AI-Powered Cyber Threats

- AI phishing attacks
- Deepfake fraud & impersonation
- AI-generated malware
- Automated attack bots

IoT Security Risks

- Weak default passwords
- Insecure smart devices
- Unpatched firmware vulnerabilities
- Large IoT botnets (DDoS risks)

Latest Cyber Security Trends (2026)

- AI-driven threat detection
- Zero Trust adoption
- Cloud-native security
- Identity-first security
- Security automation (SOAR)

Emerging Attack Surface

- Smart homes
- Connected cars
- Industrial IoT (IIoT)
- Medical devices
- Edge devices

How to Secure AI & IoT Systems

- Strong authentication (MFA)
- Device hardening
- Regular patching
- Network segmentation
- Continuous monitoring

Future of Cyber Security

- AI vs AI security battle
- Autonomous security systems
- Post-quantum cryptography
- Secure-by-design systems

- Can AI become an attacker?
- Can deepfakes bypass trust?
- Can smart devices spy on users?
- What happens when autonomous agents get hacked?
- Is AI creating more threats than defenses?
