

**Hackers don't always code;
sometimes, they just talk.**

*Welcome to the art of
Social Engineering.* 

What is Social Engineering?

- Human-based attack technique
- Targets people, not systems
- Uses manipulation + deception
- Goal: steal credentials & access
- No hacking tools required — only psychology
- Also called Human Hacking

? Why Social Engineering Works?

- Humans trust familiar names
- People respond under pressure
- Urgency reduces critical thinking
- Lack of awareness training
- Messages look legitimate
- One mistake can bypass all security layers

Main Types of Social Engineering Attacks

- **Phishing** — fake emails & login pages
- **Vishing** — voice call scams
- **Smishing** — SMS fraud messages
- **Pretexting** — fake role or story
- **Baiting** — malware via free offers
- **Tailgating** — physical access trick

Why It Works?

- **Fear** — account blocked, penalty warning
- **Urgency** — act now, limited time
- **Authority** — bank, police, company admin
- **Greed** — reward, prize, job offer
- **Curiosity** — secret file, shocking news
- **Helpfulness** — fake support request

Psychology Used by Hackers

- Rapid trust building
- Emotional pressure creation
- Information overload
- Reduced decision time
- Authority imitation
- Familiarity & personalization
- Conversation control

How Hackers Perform SE Attacks?

- **Recon** — collect target info
- **Research** — analyze habits & contacts
- **Pretext** — build fake scenario
- **Exploit** — extract data or access
- *More data about you = easier manipulation*

OSINT

How Hackers Gather Your Info

- OSINT = Open Source Intelligence
- Data from public sources
- Social media profiles
- LinkedIn job details
- Facebook posts & photos
- GitHub & portfolios
- Used to personalize attacks

Human Firewall Concept

- Technology firewalls are not enough
- One wrong click = full breach
- Every user is a security layer
- Awareness = strongest defense
- Employees = Human Firewall

How to Protect Yourself

- Never share OTP or passwords
- Verify sender & caller identity
- Hover & inspect links
- Don't react to urgency pressure
- Enable MFA everywhere
- Limit public personal info
- Report suspicious messages

Corporate Impact

- Data breach incidents
- Financial fraud loss
- Account compromise
- Internal system access
- Reputation damage
- Legal & compliance risk

Tools Hackers Use

- Phishing kits & templates
- Fake login page builders
- Caller ID spoofers
- OSINT tools
- Social media scraping
- Look-alike domain generators

Golden Rule

Trust — But Verify
